ARTIFICAL INTELLIGENCE IS PROCESS BOOK BY CALE MOOTH

EXPERIENCE DESIGN • DATA VISUALIZATION

This project was designed to help viewers understand the human perception of AI so that we may better understand the impacts of advanced technology on the human race. Data was sourced from the Twitter API and then analyzed.

AUDIENCE & CONTEXT

This analog experience targets workers in the tech industry forcing them to call into question the powerful & dangerous outcomes of AI.

Developer Platform

Search Tweets

Introduction Quick start Integrate Migrate API reference

the premium and enterprise full-enclive search products.

Learn more about the new Twitter APLv2.

and/or act upon Tweets related to a topic of interact.

rangers. This is designed to support two common use cases:

These endpoints provide similar functionality to the standard vL1 seven-day search endpoint and

You can see an overview of the Search Tweets offerings via our search overview, and can see what's new with v2 in our

Searching for Twents is an important feature used to aurised Twitter conversations about a epocific topic or event. While this functionality is present in Twitter, these endpoints provide greater flexibility and power when filtering for and ingesting Tweets so you

can find relevant data for your research more easily; build out neer-real-time "listening" applications; or generally explore, analyze,

We offer two endpoints that allow you to search for Tweets: Recent eearch and full-archive search. Both of these REST endpoints share a common design and features, including their use of a single senith query to filter for Twents around a specific topic. These scarch queries are created with a set of operators that match on Twest and usor attributes, such as massage knywords, hashtaga, and

URLs, Operators can be combined into queries with boolean logic and parentheses to help refine the queries matching behavior. Once you've set up your query and start receiving Tweets, these endpoints support navigating the results both by time and Tweet ID

Documentation

Please note

mig at on guides

Introduction

= 0

<?php require "vendor/autoload.php";

echo \$fulljson;

· Get historical: Requests are for a period of interest, with no focus on the real-time nature of the data. A single request is made, and all matching data is delivered using pagination as needed. This is the default mode for Search Tweets.

· Pelling or listening: Requests are made in a "any new Tweets since my last request?" mode, Requests are made on a continual basis, and typically there is a use case focused on near seal-time "listening" for Tweets of Interest.

Many operators and query limits are exclusive to Academic Research eccess, meaning that you must use keys and tokens from an App within a Project with Academic Research access to utilize the additional functionality. You can learn more about this in the endpoint sections below.

Both the recent search and the full-anchive search endpoints returned Tweets contribute to the monthly Tweet cap

Account setup

To access these endpoints, you will need:

- An approved developer account.
- To authenticate using the keys and tokens from a developer App that is located within a Project. Learn more about getting access to the Twitter API v2 encipolists in our getting started guide

Recent search

The recent search endpoint allows you to programmatically access filtered public Tweets posted over the last week, and is available to all developers who have a developer account and are using keys and tokens from an App within a Project.

You can authenticate your requests with OAuth 1.0a User Context, DAuth 2.0 App-Only, or OAuth 2.0 Authorization Code with PKCE. However, If you would like to receive private metrics, or a breakdown of organic and promoted metrics within your Tweer results, you will have to use CAuth 1.0a User Context or OAuth 2.0 Authorization Code with PKCE, and pass user Access Tokens that me accoclated with the user that published the given content.

This endpoint can deliver up to 100 Twents per request in reverse enroneodical order, and perination tokens are provided for pating through large sets of matching Tweets

When using a Project with Essential or Elevated access, you can use the basic set of operators and can make queries up to 512 characters long. When using a Project with Academic Research access, you have access to additional operators and can make queries up to 1024 characters long.

Loarn more about accoss Sevels

Full-archive search

Academic Research access only

The v2 full-archive search endpoint is only available to Projects with Academic Research access. The endpoint allows you to programmatically access public Twents from the complete archive dating back to the flist Twent in March 2005, based on your search query.

You can authenticate your requests to this endpoint using CAuth 2.0 App Only, and the App Access Tokian must come from an App that is within a Project that has Academic Research access. Since you cannot make a request on behalf of other users (OAuth LOa User Context or OAuth 2.0 Authorization Code with FRCE) with this endpoint, you will not be able to pull private metrics.

This endpoint can deliver up to 500 Tweets per request in reverse-chronological order, and pagination tokens are provided for paging through large sets of motching Tweeta.

Since this andpoint is only available to these that have been approved for Academic Research access, you have access to the full set of sevech operators and can make querkes up to \$024 characters long.
